Research Engineer | Physics · MSc in AI (neural networks) · Python · data and evaluation pipelines

Summary

Physicist with an MSc in Artificial Intelligence, where my thesis applied neural networks to stock-market prediction. Since then, over ten years of building production software: data engineering and backend for a London AI company, including the tool its legal experts used to label training data for the company's models, and before that a commercial platform built end to end and run for paying customers. For the last year I've worked with language models every day, building agent systems on them and benchmarking local models for latency and output quality. I want to work closer to the models again, where the maths and the engineering meet.

Education and Research

MSc in Artificial Intelligence — Universidad Veracruzana, Xalapa, Mexico · 2011–2013
Thesis: stock-market prediction with neural networks (financial time series).
Research stay: Complex Systems Laboratory, Università del Piemonte Orientale, Italy (2013)

BSc in Physics — UNAM, Mexico City · 2002–2010

Professional Experience

HexagonX — London, UK (Remote)

Data Engineer | Backend Developer · 2019–2022

- Built, solo, an internal text-tagging application used by legal experts to label training data for the company's models
- Worked closely with the data-science team on the algorithms behind the product
- Designed, built and maintained ETL pipelines for large-scale data ingestion from many incomplete, disjoint sources (petl)
- Modelled and optimised PostgreSQL, MongoDB and Neo4j databases; integrated APIs from multiple external data providers
- Built the API layer serving the product's dashboards; backend in Python (Pyramid)

Nubenautas — Mexico

Lead Developer, team of two · 2014–2018

- Built and ran, for four years, a web services management platform sold to paying customers: DNS, domains, hosting, VPN, SSL and Google GSuite
- Designed the data model and the commercial core (accounts, orders, services, recurring billing on Stripe) and kept it in step with what was provisioned across several provider APIs
- Ruby (Sinatra), PostgreSQL, JavaScript; hosted on Linode

Earlier — Mexico and Slovenia · 2013–2019
Termitnjak d.o.o (Ljubljana, 2018–2019): feasibility studies and technology evaluation. Cerebro Digital

(Mexico City, 2017–2018): science-oriented social platform on Node.js, Vue.js and MySQL. Freelance before that, including **Metabot**, algorithmic crypto trading with backtesting on historical price series.

Recent work with language models (2025–present)

Daimon — Local conversational agent, with the model chosen by measurement
Benchmarked four local models on my own hardware for speed (tokens per second, cold and warm latency) and for quality and honesty on fixed prompts, then chose one with the trade-offs written down. The persona is tested against concrete failure modes: invented facts, tacked-on trivia, interview-style questioning.
Python · Ollama · Gemma / Qwen / Llama models

Soma — Agent system for running my own life and work, in daily use for months
Claude Code operates over a markdown knowledge base under a written rule set: procedure prompts for recurring tasks, persistent memory across sessions, and tool scripts it calls (for example a Google Calendar integration over OAuth), with private data kept structurally out of the model's reach. A Telegram bot handles capture; a terminal dashboard and a local web console show the live state.
Claude Code · Claude API · Python · Telegram Bot API · systemd

RoboRally — Real-time multiplayer browser game
Game state streamed over WebSockets from a FastAPI backend to a React front end, covered by 234 tests (github.com/Yadaxim/roborally).
Python · FastAPI · WebSockets · TypeScript · React · pytest

Technical Skills

ML and maths: neural networks and time-series prediction (MSc thesis) · supervised and unsupervised learning · model evaluation and benchmarking · physics and mathematical modelling
Language models: Claude API · local models on Ollama · agent design · prompt and context design
Data: ETL pipelines · training-data labelling tools · data modelling · third-party API integration
Languages: Python · SQL · JavaScript · TypeScript · Ruby · Bash
Backend: FastAPI · Flask · Pyramid · Node.js · WebSockets · Celery · Redis
Databases: PostgreSQL · MySQL · MongoDB · Neo4j · SQLAlchemy
Tools: Git · Linux · systemd · pytest · Claude Code

Languages

Spanish — Native · English — Fluent · Slovenian — Basic
